

The peace of mind you want. The protection they need.

If you care for someone who is at risk of wandering, there's no greater peace of mind than having your loved one wear a SafetyNet Bracelet. SafetyNet's proven technology enables public safety agencies to quickly find and rescue people with cognitive disorders such as autism and Alzheimer's.

The SafetyNet Bracelet. Here's How It Works.

The SafetyNet Bracelet emits a signal assigned to your loved one. When a caregiver notifies local authorities of a wandering event, trained search and rescue personnel use SafetyNet receivers to track the signal being emitted from your loved one's bracelet. They also access a secure database with information about your loved one's physical appearance, medical condition and other information to assist in the search and rescue.

Why SafetyNet Works so Well

Unlike GPS or satellite signals, SafetyNet by LoJack uses Radio Frequency technology, which works in buildings, garages, densely wooded areas and shallow water. Time and again our tracking devices help law enforcement and public safety agencies rescue at-risk kids and adults with cognitive disabilities. The average time to find a person who wandered – regardless of where they go missing – is less than 30 minutes.

What Caregivers Are Saying About SafetyNet

"My son went missing at school, the police were called, and instead of walking around the whole building, they turned their SafetyNet antennae on and went right

to him. It all happened so fast."

-SafetyNet Caregiver, MN

"LoJack has given me the peace of mind to sleep at night and know that my son is safe."

-SafetyNet Caregiver, MA

"If I blink he's gone, so we're on top of him all the time, but having the SafetyNet bracelet...it's an added security."

-SafetyNet Caregiver, MN
